> Carewell learns the smartest way to care for someone living with dementia. We retrieve data from caregivers and their loved one, using it to better understand and personalize the care process. We gather qualitative data from caregivers through an AI chat service, Carey. In addition, we gather quantitative data from existing wearables such as Fitbit, Misfit, and Jawbone. Together, these two components allow us to understand and assist caregivers with in-home care. Caregivers have a transparent look into how their loved one is doing at any time, and we can provide actionable steps for caregivers to improve care. We then use this data to help inform neurologists and doctors about their patients care beyond what they can see in typical appointments. At a larger scale, this information can be used to help inform researchers, expand clinical trials and make progress towards a cure for this disease.
